

Production Release Notes

11/3/2020 Release 2022-10

Titanium development is managed on a regular, routine basis with scheduled monthly releases. The development environment is segregated from staging and production environments. QA and user testing is completed before releasing to production. Development is generally driven by new customer requests to further enhance Titanium capabilities and delivered on the regular production cycle. Patches are included in monthly production releases. Security patches are released immediately. Customers are not required take any update actions.

Production Release Highlights

- Amazon SES for cloud email notification replaced Microsoft e-mail account
- Switched to Symphony e-mail and fixed e-mail headers
- Added support for NE700 fan control in rules
- Added elevation to network data for Dashboard Reporting
- Updated NodeJS to latest long-term version
- Updated firmware to OpenWRT 21.02.5
- Added DevOps switches to disable light or thermostat per network
- Various updates such as improvement in Reporting Dashboard Y-Axis scaling

Firmware Update Highlights

- Firmware updated to OpenWRT 21.02.5 which included an MBSSID security fix. The OpenWRT 21.02.5 fix is recommended for networks that are using Wi-Fi and for deployment of new networks
- Note the Fan mode update did not require a firmware update
- There are no other firmware changes.
